

NEXAGRID / STRATEGY REVIEW

Turn fragmented operational data into decision velocity

A fictional technology strategy review

NexaGrid Strategy Office · 20 September 2026

Governance unlocks leverage before model expansion.

EVIDENCE

Demand signal

8 / 10 priority workflows show repeatable decision friction.

Value pool

\$18M of fictional annual leverage sits behind three workflow families.

Binding constraint

Data latency and ownership handoffs limit adoption more than model quality.

One governed semantic layer connects operating teams to reusable decisions.

Prioritize the decision layer

Scale the workflows that combine high value with a credible path to adoption.

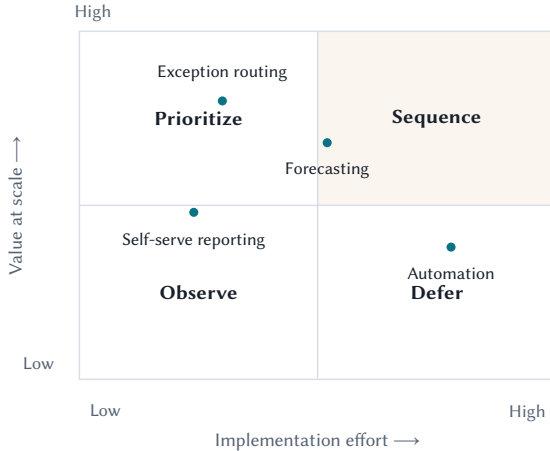

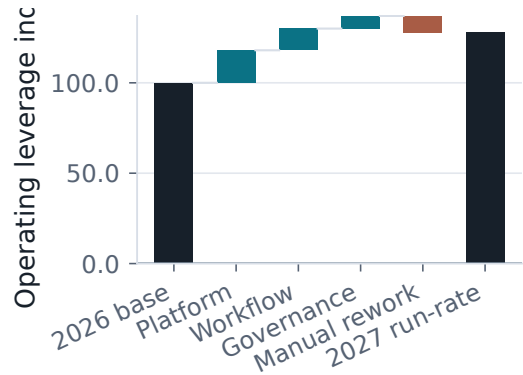

Figure 3. Priorities by implementation effort and value at scale.

Adoption compounds before automation

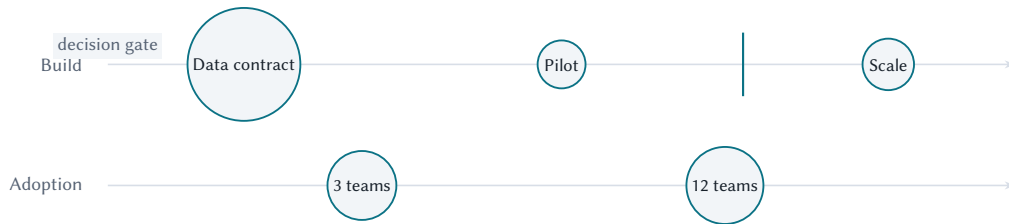

Removing rework from the operating model creates the capacity for better models and faster decisions.

Initiative	Value	Readiness
Exception routing	\$7M	Pilot
Forecasting	\$6M	Design
Contract layer	\$5M	Scale

Sequence the value pool

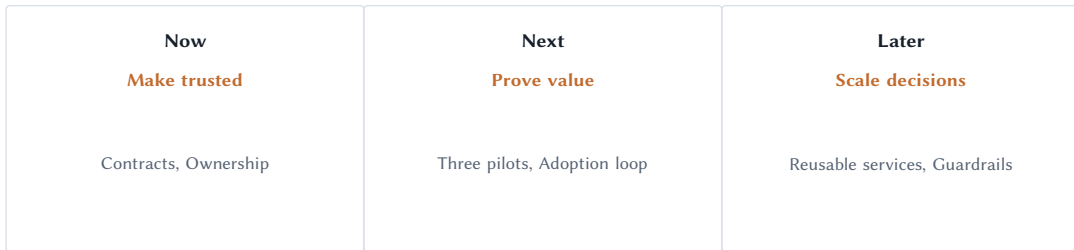

Start with repeatable decisions, then extend the same contracts into adjacent teams.

Approve the governed decision layer as the 2027 platform priority.

Fund the governed contract layer and the first three workflow pilots.

Sequence adoption milestones with build gates so value is visible early.

Hold model expansion until ownership, latency, and feedback loops are measured.
